

What is TIP Clinic?

TIP Clinic translates personalized temporal interference (TI) treatment planning from research into everyday clinical practice.

This medical device-certified software is designed for the high-precision TIBS-HOME Series and builds on the proven technologies and extensive user feedback of *TIP Research*, developed by the IT'IS Foundation. It combines the validated planning engine of *TIP Research* with a streamlined, clinician-

oriented workflow that requires no computational modeling expertise.

Starting from patient magnetic resonance images, TIP Clinic automatically generates a personalized head model and guides clinicians through every step of the treatment planning process – from electrode placement and current optimization to the quantitative evaluation of TI metrics at the target brain location – all within an intuitive, easy-to-use interface.
